

StoredIQ

eDiscovery Preparedness

For proactive, litigation-ready response

KEY FUNCTIONS & BENEFITS

- Quickly and easily deploy your StoredIQ appliance in-house.
- Crawl and classify active data on your network servers, storage systems and personal computers without disrupting your end users.
- Maintain multiple active indexes of system metadata, full text and tagged concepts for all objects in your enterprise.
- Implement consistent records management, litigation holds and document destruction policies.
- Enable incident-based collection, preservation, culling and production of electronically stored information (ESI) to respond to eDiscovery projects.

- Proactively discover, classify and manage all objects according to business value and risk.
- Consistently implement litigation hold and collection and preservation processes.
- Proactively destroy records that do not meet your records retention policies.

StoredIQ eDiscovery Preparedness is an enterprise-class, software-based appliance designed specifically for proactive eDiscovery and litigation preparedness.

Unlike traditional records management systems or generic enterprise search solutions, StoredIQ eDiscovery Preparedness helps organizations to make appropriate decisions before litigation about the retention, deletion, and security of their unstructured data. As a result, they are better prepared to respond to litigation while also adhering to regulatory compliance and corporate information governance policies.

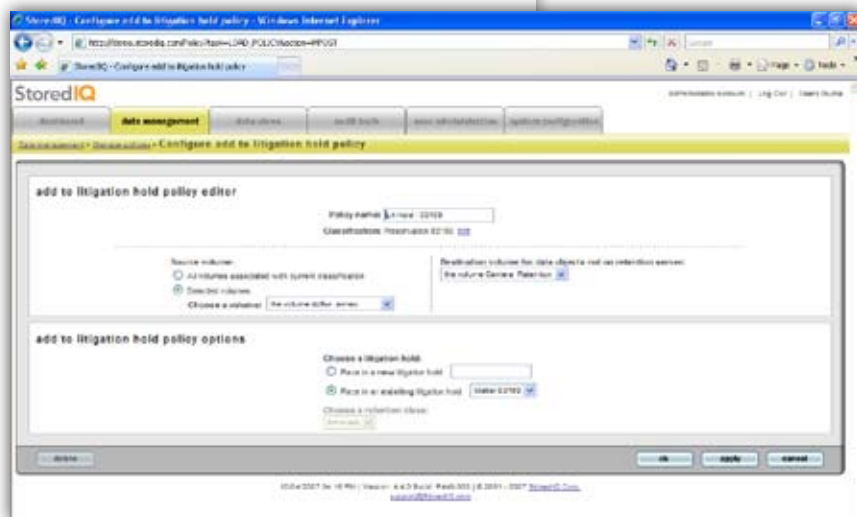

Part of a comprehensive, platform-based solution

In addition to eDiscovery Preparedness, StoredIQ provides companies with application modules for Intelligent eDiscovery and Information Governance.

Each application is built upon a common software platform, allowing for application modules to seamlessly operate on the same appliance cluster. This modular approach enables you to purchase only the functionality you need, then add modules as your needs evolve.

A powerful engine for classification and policy implementation

StoredIQ eDiscovery Preparedness can help accelerate understanding with a powerful engine for classification and policy implementation. An intuitive web interface allows users to easily create and define linguistically enabled custom classification lexicons or choose from over 50 out-of-the-box entities.

Users can selectively apply litigation hold retention policies based upon classifications created from system, object and content attributes – or apply an expansive litigation hold across an entire storage volume.

Implementation policies are based on a large variety of classifications. Policies can be defined to associate an appropriate action (such as retain or secure) and apply it to positively identified and classified objects. Policies are symmetrically scaled across the StoredIQ platform to improve performance and scalability. Deep policy auditing at the individual item level is also supported.

Efficient preservation with topology mapping

Data topology mapping can identify target custodians and data prior to collection and preservation, helping the legal team preserve the “right” amount of ESI without under or over preserving. These reports are also valuable negotiation tools for “meet & confer” conferences.

Early detection and remediation of business risk

Using the linguistically enabled classification function provided by StoredIQ eDiscovery Preparedness, users can identify content that does not comply with corporate governance policies and ensure these issues are addressed before they become legal problems. Out-of-the-box privacy classifications pinpoint personally identifiable content, so users can easily define security or migration policies that address the increasing demand of state and federal privacy laws.

StoredIQ eDiscovery Preparedness in action

StoredIQ eDiscovery Preparedness delivers a range of functionalities for true “litigation preparedness” and support for compliance efforts.

Records Management

In a clustered configuration with distributed capabilities, StoredIQ eDiscovery Preparedness products ensure that organizations have the reach they need for a thorough inventory. Approximately 300 different file types can be recognized while accessing multiple volumes simultaneously and managing hundreds of millions of objects, at great speed.

With the patent-pending classification editor, risk management teams can encode rules that identify risk that has led to previous legal matters and activate policies to ensure proper notification. The product provides 18 dimensions of individually identifiable information, such as social security or credit card numbers, that can be enabled and associated with secure or migrate policies to ensure automated remediation.

Storage Management

StoredIQ eDiscovery Preparedness provides deep integration into file systems and NAS devices that communicate using CIFS,

NFS and Netware protocols. It also features a comprehensive storage management dashboard that articulates storage utilization by owner, duplicate, activity, age, location, type and category enabling you to easily create system meta-data based classifications for use in security and migration policies.

The product has both active and passive Hierarchical Storage Management (HSM) policy support with active integration into both NetApps Fpolicy and EMC File Mover interfaces. HSM policies can be defined to use EMC’s Centera, NetApp Snaplock or any NFS/CIFS share as the secondary storage target.

eDiscovery

StoredIQ eDiscovery Preparedness identifies, collects and preserves active ESI on network servers, storage systems and personal computers—without disrupting end users. What’s more, the product enables a legal team to cull down potentially responsive data using system, object metadata and content filtering. It also produces review ready output of native files with Concordance or standards-based XML load files.

Specifications

- > Available as a portable appliance or in multi-node cluster configurations.
- > Includes OS (Linux), web server, application server, SQL database server.
- > Appliance includes on-board storage configured as RAID 5 hot swappable hard drives for managing indexes, reducing implementation time and simplifying management.

Integrations

File systems, including

- CIFS
- NFS
- Netware

Email systems, including

- Microsoft Exchange
- Lotus Notes (email databases)

Content management systems, including

- Microsoft SharePoint
- EMC Documentum

Storage systems, including

- NetApp Snaplock
- EMC Centera
- IBM DR550
- Hitachi Archivas
